- \*Corresponding author (claudia.andrade@umag.cl)

The following tables summarise the data and results related to the study of the network of trophic (predator-prey) interactions, food web, for the Strait of Magellan ecosystem.

Table 1 is the complete list of trophic interactions and references that confirm each of them.

Table 2 is the species list with details on trophic species cases (aggregated taxa) and its properties (e.g. degree, closeness, betweenness, Keystone Species Index -KSI-, trophic position, and topological role).

Table 3 shows the results for the small-world pattern analysis, following Marina et al. (2018) (<https://doi.org/10.1371/journal.pone.0198217>).

Table 4 shows the results of the cumulative degree distribution fit of the food web.

Table 1: List of predator-prey (trophic) interactions used to build the food web of the Strait of Magellan. References and link to them (Link) are provided for each interaction.

Table 3: Results of the small-world fit after comparing empirical and random Path Length and Clustering Coefficient properties. 1000 random networks were built for comparison with the empirical case. EmpPL: Empirical Path Length; EmpCC: Empirical Clustering Coefficient; RndPLLow: Path Length confidence interval lower limit for random networks; RndPLUp: Path Length confidence interval upper limit for random networks; RndCCLow: Clustering Coefficient confidence interval lower limit for random networks; RndCCUp: Clustering Coefficient confidence interval upper limit for random networks. Note that the empirical path length (EmpPL) is shorter than the confidence interval for its random counterpart (RndPLLow-RndPLUp) and the empirical clustering coefficient (EmpCC) is greater than the confidence interval for its random counterpart (RndCCLow-RndCCUp).

EmpPL	EmpCC	RndPLLow	RndPLUp	RndCCLow	RndCCUp	SW
1.885	0.09321	4.095	4.59	0.0267	0.0639	TRUE

Table 4: Results of the degree distribution fit. Exponential and power law model families were tested, and AIC (Akaike Information Criterion) and BIC (Bayesian Information Criterion) were used to select the best fit (i.e., lower AIC and BIC). The exponential model is the best fit.

AIC	BIC	Model family	Model
-167.4	-163.3	Exponential	Exp
-53.88	-49.99	PowerLaw	Power
-0.8384	3.049	Exponential	LogExp
59.1	62.98	PowerLaw	LogPower
